CHAPTER 05 - DYNAMICS

ACCELERATED: this is not an inertial frame of reference

ACCELERATION: on a mass, an unbalanced force always causes that

APPARENT: in an accelerated frame of reference, true and _____ weights differ

ATM: abbreviation of atmospheres of pressure

ATMOSPHERE: atmospheric pressure at sea level is one _____

COEFFICIENT: _____ of friction depends on the two materials that make contact

CONSTANT: the speed is that when the net force is zero

CORIOLIS: small forces arising from the rotation of the earth

DECELERATE: the force of friction always causes bodies to do that

DIFFERENT: action-reaction forces always act on _____ objects

DISTANCE: using a lever results in a trade between force and that

DIVIDED: mass is equal to the force _____ by the acceleration

DYNAMIC: in this type of equilibrium a body moves with a constant velocity

DYNAMICS: it is the study of forces

DYNE: unit of force in the CGS system

EARTH: that body is pulling you with a force that is equal to your own weight

ELECTROMAGNETIC: this force in nature gives materials their strength

EQUILIBRIUM: it occurs when Summation of Forces = 0 and the Summation of Torques = 0

FIFTY: from rest, a force of 20 N on a mass of 5 Kg will travel that distance in meters in 5 s

FIRST: this Newton's law is often called the Law of Inertia

FORCE: simple machines multiply that

FORCES: they cause changes in motion

FOUR: this acceleration in m/s^2 is caused by a 20 N force on a 5 Kg mass

FOURTEEN: this force in newtons is needed to accelerate a 2 Kg mass at 7 m/s^2

FRICITION: it appears when two surfaces make contact

FULCRUM: fixed point where a bar is free to move about
GALILEO: he demonstrated that all objects are uniformly accelerated by gravity
GRAVITATIONAL: this force in nature keeps the solar system together
GRAVITY: it is equal to $\text{Weight} \div \text{Mass}$
GREATER: the maximum value of μ_s is _____ than μ_k
HEAT: it appears whenever there is friction
INERTIA: tendency of a body to keep its state of motion
INERTIAL: Newton's laws of motion hold true in any frame of reference of that type
KINEMATICS: it is the study of motion
KINETIC: this friction is smaller than the maximum force of static friction
LEVER: one of six simple machines
MASS: it is not changed by different gravitational field strengths
MATTER: mass is the amount of that a body has
MU: the coefficient of friction is represented by the Greek letter μ
NET: this force is equivalent to all the forces acting on a body
NEWTON: unit of force in the MKS system
NORMAL: this force always act perpendicular to the surfaces in contact
OPPOSITE: in relation to the direction of motion, the force of friction is always that
PAIRS: forces are always present that way
PASCAL: the newton/m^2 is also known as that
PHYSICS: Newton's work on dynamics became the foundation of

PRESSURE: it is defined as Force per unit of Area
PRINCIPIA: title of the physics book written by Newton
PSI: a pound per squared inch
PULL: a type of force
PULLEY: one of six simple machines
PUSH: a type of force
REACTION: rockets are propelled by this force
SCALAR: mass is a _____ quantity
SECOND: this Newton's law says that $\text{force} = \text{mass} \times \text{acceleration}$
SEVEN: a mass of 7 Kg on Earth will have that mass in Kg on the moon

SIX: number of simple machines

SIXTY: a force of 20 N on a mass of 5 Kg will cause a gain of that velocity in 5 s

SLIDING: _____ friction is another term for kinetic friction

STATIC: force of friction that opposes the start of motion

STRONG: this force keeps the nucleus of the atom together

TEN: a N/m^2 is equal to this number of dyne/cm^2

TENSION: force present in a string or rope

TERMINAL: this velocity is reached when skydivers fall at 250 Km/h approx.

THIRD: this Newton's law deals with action-reaction forces

THIRTY: this force in newtons will stop in 5 s a 5 Kg mass that is moving at 30 m/s

TORQUE: this force causes rotation

TWELVE: this force in newtons on a pulley with 4 supporting strings can lift a 48 N weight

TWENTY: a force of 10 N causes this change in velocity in m/s on a 2 Kg mass in 4 s

TWO: a force of 10 N causes this acceleration in m/s^2 on a 5 Kg mass

VARIABLE: the force of static friction is that

VECTORS: force and acceleration are _____

WEAK: this force is responsible for radioactivity

WEIGHT: name of the force experienced by a mass in a gravitational field

ZERO: this is the net force when there is equilibrium

Name: _____ Date: _____ Period: _____ Score: _____

To answer each of the following 26 questions, please select the appropriate word from the list at the bottom of the page. On the space provided on the left side of each question, you just need to write the letter of the alphabet located next to the correct word.

1. _____ Fixed point where a bar is free to move about
2. _____ This force always act perpendicular to the surfaces in contact
3. _____ This force in newtons is needed to accelerate a 2 Kg mass at 7 m/s^2
4. _____ They cause changes in motion
5. _____ On a mass, an unbalanced force always causes that
6. _____ It is the study of forces
7. _____ This force in newtons will stop in 5 s a 5 Kg mass that is moving at 30 m/s
8. _____ Small forces arising from the rotation of the earth
9. _____ Name of the force experienced by a mass in a gravitational field
10. _____ Mass is that type of quantity
11. _____ This force in newtons on a pulley with 4 supporting strings can lift a 48 N weight
12. _____ Title of the physics book written by Newton
13. _____ A type of force
14. _____ This force is equivalent to all the forces acting on a body
15. _____ A N/m^2 is equal to this number of dyne/cm^2
16. _____ Tendency of a body to keep its state of motion
17. _____ A force of 10 N causes this acceleration in m/s^2 on a 5 Kg mass
18. _____ Force of friction that opposes the start of motion
19. _____ This Newton's law is often called the Law of Inertia
20. _____ This velocity is reached when skydivers fall approximately at 250 Km/h
21. _____ That body is pulling you with a force that is equal to your own weight
22. _____ A force of 20 N on a mass of 5 Kg will cause a gain of that velocity in 5 s
23. _____ A mass of 7 Kg on Earth will have that mass in Kg on the moon
24. _____ It occurs when the Summation of Forces = 0 and the Summation of Torques = 0
25. _____ The maximum value of μ_s is that in reference to the value of μ_k
26. _____ Force and acceleration are that type of quantity

CHAPTER 26 - THE NUCLEUS

ABSORBED: "dose" is the energy deposited per unit mass by _____ radiation

ACTINIUM: uranium becomes that element when the nucleus captures 3 electrons

ACTIVITY: the number of radioactive disintegrations per unit time is called the _____ of a substance

ALPHA: these particles have 2 protons and 2 neutrons

ANDERSON: Carl _____ discovered the positron in 1932

ANGULAR: _____ momentum is conserved during nuclear reactions

ANTIMATTER: matter collides with that during gamma decay

ANTINEUTRINO: the decay of a neutron produces a proton, an electron, and a(n) _____

ANTIPARTICLE: the positron is the name of the _____ of the electron

ATOMIC: isotopes have the same _____ number but different _____ mass

BACTERIA: radioactive isotopes are also utilized to kill that

BECQUEREL: it is the SI unit of (radioactive) activity

BETA: these particles are just high speed electrons

BILLION: one curie is equal to 37 _____ disintegrations per second

BINDING: energy required to remove an electron from the atom

BRAIN: the isotope carbon-14 is used in medicine to treat tumors in that organ

BUBBLE: the _____ chamber is used to detect subatomic particles. It uses a liquid

CANCER: the radioisotope cobalt-60 is utilized to treat this disease

CARBON: this element has a mass of 12.000000 unified atomic mass units

CHADWICK: he discovered the neutron in the year 1932

CHARGE: it is conserved during nuclear reactions

CIRCULATORY: doctors use the isotope sodium-24 to detect problems in this system

CLOUD: the _____ chamber is used to detect subatomic particles. It uses a gas

CURIE: sometimes this unit of (radioactive) activity is used

DECAY: nuclear reaction taking place spontaneously

DETECTED: the neutrinos were first _____ in the year 1953

DEUTERIUM: an isotope of hydrogen

DEUTERON: a nucleus containing one proton and one neutron

DIRAC: he proposed the existence of antimatter in the universe

DISINTEGRATION: the unit "becquerel" indicates one (radioactive) _____ per second

DOSE: "gray" is the SI unit of _____

EIGHT: carbon containing this number of neutrons in the nucleus is utilized for carbon dating

EIGHTY: number of original particles if after 4 half-lives there are 5 particles left

EINSTEIN: he deduced the equation $E = mc^2$

ELECTRON: this particle is often called the beta minus

ELECTRONIC: X-rays are produced by this type of excitations

ELECTRONVOLT: unit of energy

ENERGY: mass become that during nuclear reactions

EXCITATIONS: gamma rays are produced by nuclear _____

FEMTOMETER: convenient unit to measure nuclear distances

FERMI: Enrico _____ was the first one to split a nucleus by using neutrons as bullets

FIFTEEN: it is the half-life in minutes if the number of particles change from 80 to 5 in 1 hour

FISSION: nuclear reactions occurring at the Turkey Point nuclear plant

FIVE: the atomic number decreases by this number after emitting 5 positrons

FREE: when it is _____, the neutron has a half-life of about 14 minutes

FUSION: nuclear reactions taking place in the sun

GAMMA: these particles have no electrical charge

GEIGER: the _____ counter can detect charged particles

GOLD: if the nucleus of mercury could capture one electron it would become that

GRAY: one _____ = 1 Joule/Kg

HELIUM: an alpha particle is the nucleus of that element

HYDROGEN: tritium is a radioactive form of _____

ISOTOPES: they have the same number of protons but different number of neutrons

LEAD: an uranium nucleus stops decaying when it becomes that element

LIGHT: gamma particles travel at the same speed as _____

LINEAR: _____ momentum is conserved during nuclear reactions

MASS: it is not conserved during nuclear reactions

MATTER: the equation $E = mc^2$ gives the relation between _____ and energy

MERCURY: many alchemists have dreamed turning this element into gold

MIDAS: king of Phrygia with the power of turning things into gold

MILLION: gamma particles can have energies of more than one _____ eV

MOMENTUM: two particles are produced during gamma decay for that to be conserved

NEGATIVE: beta particles have this type of charge

NEGATRON: another name for a beta particle

NEON: J. J. Thomson discovered in the year 1900 an isotope of that gas

NEUTRINO: the name of this particle means "little neutral one"

NEUTRON: a proton turns into that during electron capture

NINETY: 1 gram of matter can generate this number of terajoules of energy

NUCLEAR: mass + energy is conserved in these reactions

NUCLEONS: protons and neutrons are called that

NUCLIDE: name given to any combination of protons and neutrons

NUMBER: the atomic _____ increases by one during beta decay

PAULI: he suggested in 1934 that during beta decay another unknown particle was produced

PENETRATING: gamma particles have the greatest _____ power

PLUS: the positron is also called the beta _____ particle

PLUTONIUM: uranium becomes that element after two consecutive beta decays

POSITIVE: alpha particles have this type of charge

POSITRON: the nucleus of mercury has to emit this particle to turn into gold

PROTON: a neutron changes into that during beta decay

RAD: another unit utilized to measure dose

RADIOACTIVITY: Henry Becquerel discovered _____ in the year 1896

RADIOISOTOPE: a radioactive isotope produced artificially

RADIUM: one gram of that element goes through 37 billion disintegrations per second

ROENTGEN: unit that denotes the amount of radiation

RUTHERFORD: he discovered the nucleus of the atom in the year 1911

SCINTILLATION: the _____ counter can detect charged particles and high frequency photons

SIX: after this number of half-lives 1,600 particles decrease to 25

STARS: they produce millions of tons of helium every second

SUGGESTED: Enrico Fermi called "neutrino" the unknown particle _____ by Pauli during beta decay

SUN: it emits particles that are trapped in the Van Allen belts

SYNTHETIC: elements beyond atomic number 92 are called that

TEN: the atomic number decreases by this number after 5 consecutive alpha decays

THORIUM: uranium becomes that element after an alpha decay

THYROID: the isotope iodine-131 is utilized in medicine to study this important human gland

TRACERS: they are radioactive elements whose performance can be followed in the human body

TRANSMUTATION: nuclear reaction induced artificially

TRANSURANIUM: elements beyond atomic number 92 are known as _____ elements

TRITIUM: a nucleus containing one proton and two neutrons

TWENTY: the atomic mass decreases by this number after 5 consecutive alpha decays

TWO: number of gamma particles produced during gamma decay

URANIUM: after emitting 4 positrons this element becomes radium

WORK: _____ function is another name for binding energy

Name: _____ Date: _____ Period: _____ Score: _____

SUN
THYROID
TRANSMUTATION
TRITIUM

INSTRUCTIONS:

1. Find all the shown words in the Word Search Puzzle.
2. Use each word to form a sentence that is relevant to the topic studied. Your sentences must involve useful concepts or facts, and your grade will depend on the quality of the sentences formed.

Solution

ALPHA
 ANGULAR
 ANTINEUTRINO
 ATOMIC
 BETA
 BUBBLE
 CARBON
 CURIE
 DEUTERIUM
 DIRAC
 DOSE
 ELECTRON

ELECTRONVOLT
 FEMTOMETER
 FISSION
 GAMMA
 GOLD
 HELIUM
 ISOTOPES
 LIGHT
 MATTER
 MIDAS
 NEGATRON
 NEUTRINO

NUCLEAR
 NUCLIDE
 PENETRATING
 POSITRON
 RAD
 RADIOISOTOPE
 ROENTGEN
 SCINTILLATION
 SUN
 THYROID
 TRANSMUTATION
 TRITIUM

Name: _____ Date: _____ Period: _____ Score: _____

To answer each of the following 26 questions, please select the appropriate word from the list at the bottom of the page. On the space provided on the left side of each question, you just need to write the letter of the alphabet located next to the correct word.

1. _____ One gram of that element goes through 37 billion disintegrations per second
2. _____ Elements beyond atomic number 92 are called that
3. _____ A neutron changes into that during beta decay
4. _____ Name given to any combination of protons and neutrons
5. _____ The radioisotope cobalt-60 is utilized to treat this disease
6. _____ An uranium nucleus stops decaying when it becomes that element
7. _____ They are radioactive elements whose performance can be followed in the human body
8. _____ King of Phrygia with the power of turning things into gold
9. _____ Elements beyond atomic number 92 are known as that
10. _____ Uranium becomes that element when the nucleus captures 3 electrons
11. _____ Mass become that during nuclear reactions
12. _____ Doctors use the isotope sodium-24 to detect problems in this system
13. _____ Nuclear reactions taking place in the sun
14. _____ After this number of half-lives 1,600 particles decrease to 25
15. _____ It is the half-life in minutes if the number of particles change from 80 to 5 in 1 hour
16. _____ Mass + energy is conserved in these reactions
17. _____ The atomic mass decreases by this number after 5 consecutive alpha decays
18. _____ The atomic number decreases by this number after emitting 5 positrons
19. _____ Tritium is a radioactive form of that
20. _____ A proton turns into that during electron capture
21. _____ The isotope carbon-14 is used in medicine to treat tumors in that organ
22. _____ That momentum is conserved during nuclear reactions
23. _____ Uranium becomes that element after an alpha decay
24. _____ After emitting 4 positrons this element becomes radium
25. _____ It is the SI unit of (radioactive) activity
26. _____ He discovered the nucleus of the atom in the year 1911

To answer each of the following 26 questions, please select the appropriate word from the list at the bottom of the page. On the space provided on the left side of each question, you just need to write the letter of the alphabet located next to the correct word.

1. _____ Uranium becomes that element after two consecutive beta decays
2. _____ They produce millions of tons of helium every second
3. _____ He discovered the positron in 1932
4. _____ 1 gram of matter can generate this number of terajoules of energy
5. _____ It is conserved during nuclear reactions
6. _____ The atomic number decreases by this number after 5 consecutive alpha decays
7. _____ Protons and neutrons are called that
8. _____ An isotope of hydrogen
9. _____ Nuclear reaction induced artificially
10. _____ Number of gamma particles produced during gamma decay
11. _____ He proposed the existence of antimatter in the universe
12. _____ Nuclear reaction taking place spontaneously
13. _____ The isotope iodine-131 is utilized in medicine to study this important human gland
14. _____ This element has a mass of 12.000000 unified atomic mass units
15. _____ The number of radioactive disintegrations per unit time is called that characteristic of a substance
16. _____ The nucleus of mercury has to emit this particle to turn into gold
17. _____ A nucleus containing one proton and two neutrons
18. _____ Many alchemists have dreamed turning this element into gold
19. _____ Number of original particles if after 4 half-lives there are 5 particles left
20. _____ They have the same number of protons but different number of neutrons
21. _____ He was the first one to split a nucleus by using neutrons as bullets
22. _____ It is not conserved during nuclear reactions
23. _____ Unit that denotes the amount of radiation
24. _____ Nuclear reactions occurring at the Turkey Point nuclear plant
25. _____ This particle is often called the beta minus
26. _____ A radioactive isotope produced artificially
